Name of Authorizing Physician \_\_\_\_\_

The HIV-1/2 antibody result from the **Rapid HIV Antibody Test** is:

**Non-Reactive  
(Negative)**

**Reactive  
(Preliminary Positive)**

**Invalid**

**Type of Specimen:** Rapid test, finger stick with whole blood   
Oral Fluid Specimen

**Meaning of the test result:**

A **non-reactive (negative)** test result means that no antibodies to HIV-1 have been detected. HIV antibodies may be absent during the “window period” of infection. Follow-up testing may be necessary if indicated by risk factors.

A **reactive (preliminary positive)** test result suggests that antibodies to HIV-1 may be present in the blood obtained from a rapid, finger stick test with whole blood. A specimen will have to be sent to a laboratory for a Western Blot test prior to confirmation of the reactive test result. Precautions should be taken to avoid the chance of spreading HIV.

An **invalid** test result resulting from a rapid finger stick can be due to a problem running the test or an interfering substance in the specimen. A specimen using other testing technology should be collected and submitted to a laboratory for HIV testing.

**Questions:** If you have any questions about the rapid test result, please contact the Authorizing Physician.
