MECM System Physical Architecture — Cloud Landing Zone Concept (REDACTED)

REDACTED FOR PUBLIC RELEASE — generalized concept view. The cloud organization and account topology, organizational-unit names, account names and naming convention, tenant identifier, per-account VPC and disaster-recovery inventory, public DNS and ingress anchor points, and named governance, detection and logging services have been removed.

Conceptual view only. The environment is organized under a single cloud organization root with centrally applied preventive controls, a regulated partition holding all workloads with isolated security, audit, network, identity and recovery zones, and a commercial partition retained solely for the billing relationship. Centralized threat detection, audit logging and configuration monitoring are in place; the specific services and their host accounts are withheld.
