MECM System High-Level Integrations — Generalized View (REDACTED)

REDACTED FOR PUBLIC RELEASE — generalized partner-category view. The per-interface enumeration and interface identifiers, the transport tagging of each flow, the sensitive data elements named on individual flows, the cross-system identity, case and invitation-code linking mechanisms, named commercial vendors, and the internal subsystem and sub-function breakouts have all been removed.

Purpose of the integration set (stated at category level only): eligibility and coverage determination support, enrollment processing, referral and case coordination, identity and status verification, correspondence and notification, and payment administration. The released view deliberately does not associate any one purpose with any one partner or channel.

Withheld in aggregate: the consolidated map of every connection into and out of the system. Individually the interface facts are routine; assembled into one view they form a complete attack-surface and data-flow map showing which channels carry the highest-value data, which are live reachable service endpoints versus scheduled file exchanges, and how the ecosystem is wired together. That aggregation is the disclosure.
