<u>Clinical Risk Group Analysis</u>

This subcommittee will be looking at ways to incorporate additional data into the order to increase the accuracy of assigned acuity scores. The goal of this subcommittee is to provide specific suggestions and feedback related to factors that could incorporated into to increase accuracy of scoring.

Items such as recent homelessness or incarceration, adherence concerns, untreated mental health/substance use concerns and concurrent medical conditions will be considered. Additional psycho-social and cultural factors that present barriers to care acquisition and/or retention in care are also of interest. It is necessary to evaluate practical ways that these data items can be obtained and/or submitted for incorporation and whether or not certain items might be "weighted," due to their predictive value of increased acuity.

The subcommittee will be meeting every two weeks and is expected to meet for a period of approximately two months.
