## Background

In accordance with Public Health Law (PHL) § 2819, New York State (NYS) has been tracking hospital-acquired infections (HAIs) since 2007. This law was created to provide the public with fair, accurate, and reliable HAI data to compare hospital infection rates and to support quality improvement and infection prevention activities in hospitals.

The NYS Department of Health (NYSDOH) evaluates which HAI indicators should be reported annually with the help of a Technical Advisory Workgroup (TAW), a panel of experts in the prevention and reporting of HAIs. In addition to reporting the HAI data mandated by NYS, hospitals enter data into the National Healthcare Safety Network (NHSN) for federal programs (e.g., Centers for Medicare and Medicaid Services [CMS]), regional collaboratives, and local surveillance. NYSDOH can access these other data through a data use agreement (DUA) with the Centers for Disease Control and Prevention (CDC). These data are only reported in aggregate and therefore were included in the main body of the 2021 HAI Annual Report.

Table 1 summarizes the progression of NYS reporting requirements through 2022 and includes additional data available through the DUA.

**Table 1. HAIs reported by NYS hospitals, by year**

Type of Infection	2007	2008	2009	2010-2011	2012	2013	2014	2015-2018	2019	2020+*
Central line-associated bloodstream infections in ICUs	P <sup>1</sup>	✓	✓	✓	✓	✓	✓	✓	✓	✓
Colon surgical site infections	P <sup>1</sup>	✓	✓	✓	✓	✓	✓	✓	✓	✓
Coronary artery bypass graft surgical site infections	P <sup>1</sup>	✓	✓	✓	✓	✓	✓	✓	✓	✓
Hip replacement surgical site infections		✓	✓	✓	✓	✓	✓	✓	✓	✓
<i>Clostridioides difficile</i> infections			P <sup>2</sup>	✓	✓	✓	✓	✓	✓	✓
Abdominal hysterectomy surgical site infections					✓	✓	✓	✓	✓	✓
Carbapenem-resistant Enterobacterales infections						P <sup>2</sup>	✓	✓	✓	✓
Central line-associated bloodstream infections in medical/surgical/medical-surgical/step-down wards						DUA	DUA	✓	✓	✓
Spinal fusion surgical site infections									✓	✓
Central line-associated bloodstream infections in oncology and mixed-acuity units									✓	✓
Central line-associated bloodstream infections in telemetry units										✓
Catheter-associated urinary tract infections						DUA	DUA	DUA	DUA	DUA
Methicillin-resistant <i>Staphylococcus aureus</i> bacteremia						DUA	DUA	DUA	DUA	DUA

✓ = full reporting (publish hospital-specific rates)

P<sup>1</sup> = pilot reporting full year (do not publish hospital-specific rates)

P<sup>2</sup> = pilot reporting half year from July (do not publish hospital-specific rates)

DUA = Not required by NYS but reported for CMS programs and available through a DUA between CDC and NYS beginning May 2013.

\* Reporting was suspended from January through June 2020 due to the COVID-19 pandemic.

## **COVID-19 and its impact on healthcare systems and HAI reporting in the US**

COVID-19 disrupted nearly every aspect of life, including healthcare systems around the world. Hospitals were overwhelmed with very sick people requiring longer hospital stays and with severe co-morbidities requiring intensive care unit (ICU) admission with central lines or other invasive devices. Most hospitals provided only emergent services and postponed elective surgeries, including many indicators monitored by NYSDOH. Due to these circumstances, CMS implemented the [Extraordinary Circumstances Exception \(ECE\) Policy \[PDF – 10 pages\]](#) that excused facilities from HAI surveillance and reporting via NHSN for the 2019-Q4 through 2020-Q2 reporting quarters. During this time, facilities were not required to report HAI data to CMS’s reporting programs. NYS did not require state-mandated HAI reporting for the time period January through June, 2020 and is opting not to publish a full separate annual report for 2020. Statewide data for 2020 are included in the 2021 report, and hospital specific HAI rates for 2020 are presented in this appendix to that report.

### **Limitations on 2020 HAI Data**

In the spirit of full transparency, NYS is publishing data collected in the latter half of 2020 in this appendix but with considerable concern regarding its accuracy and completeness. Given persisting challenges related to the COVID-19 pandemic in this time period, it is likely that decreased surveillance activities and reporting via NHSN occurred. At the same time, NYS staff who normally audit data were reassigned to address the more imminent threat of COVID-19.

Additionally, given the fluctuation of COVID-19 rates regionally and over time, comparing the data within this 6-month period has the potential to yield inaccurate interfacility comparisons. Additionally, calculating rates using 6 versus 12 months of data makes comparison of 2020 rates to 2019 or 2021 rates for the same hospital potentially biased if rates of a given indicator fluctuate from month to month.

Barriers to primary and specialty care appointments, as well as postponing of elective procedures likely also increased the acuity of patients that underwent at least some of the procedures monitored by this program. For example, if a patient needed a coronary-artery bypass graft (CABG), the diagnosis of the issue necessitating the procedure might be delayed, as would the actual surgery. Both of these might cause the patient to be sicker than they otherwise might be at the time of surgery in ways that it is not possible to control for. In fact, a 3.4% increase in CABG procedures designated as emergent (Emergency=Yes) was seen when comparing 2019 to 2020 data. This makes a fluctuation in rates likely and comparison to other years suspect.

These factors, separately and in combination, make risk adjustment and statistical comparison of hospitals problematic at best. Therefore, NYS has opted not to flag hospitals as high or low for 2020 and has excluded 2020 data from categorizing hospitals according to the repeated high rate policy ([Hospital-Acquired Infection \(HAI\) Rates in New York State Hospitals \(ny.gov\)](#)). NYS recommends caution in making any decisions based on data presented in this appendix.

## **Surgical Site Infections (SSI)**

Test method: Non-Sens.= less sensitive test (e.g. enzyme immunoassay), Sensitive = more sensitive test (e.g. nucleic acid amplification test).

OP: Outpatient, \*CO-NMH: community onset-not my hospital, \*CO-PMH: incident community onset-possibly my hospital,

HO: hospital onset, HO rate is per 10,000 patient days, HO rate adjusted using test method, CO-NMH rate, number of beds, and percent of patient days in adult intensive care units.NA= Specialty hospitals not risk adjusted Reported as of August 15, 2022.

**Hospital carbapenem resistant enterobacterales rates, New York State, 2020**
